Cogtics – Comprehensive UX Plan

Role-Adaptive, Evidence-First Revenue Command Center

1. UX Mission & North Star

Cogtics is designed as a revenue command center that enables finance teams to detect, understand, validate, simulate, and act on revenue risk with confidence. The UX prioritizes trust, clarity, financial impact, and auditability.

2. UX Philosophy

The interface is adaptive by role, opinionated but cautious, evidence-forward, and audit-grade. It guides users toward high-impact actions while hiding low-confidence results.

3. Primary Mental Model

The system is issues-first and impact-driven. Users think in terms of financial impact rather than raw data sources or systems.

4. Navigation Structure

Flat navigation with core sections: Executive Summary, Issues, Contracts, Revenue Recognition, Simulations, Exports, Integrations, Settings, and Audit.

5. Role-Based UX Behavior

CFOs see summarized views by default. Analysts see detailed investigative views. Admins control detection logic, integrations, and system settings.

6. Onboarding Experience

Free-form onboarding checklist with background syncing. Users can explore partial data and guided demo data before full sync completion.

7. Integrations UX

Integrations are infrastructure-like but visible. Partial data is allowed with clear banners. Users can disable objects and date ranges.

8. Contracts UX

Only relevant extracted terms are shown. Ambiguities are resolved via a task inbox. Conflicts are displayed through comparison views with clause-level evidence.

9. Issues UX

Issues are grouped by financial impact. No auto-resolution. Issues are living cases that evolve as data updates. False positives and accepted leakage are tracked separately.

10. Evidence & Explainability

Evidence is expandable by default. Raw API payloads are hidden. Calculations are shown as tables with optional formulas. Confidence indicators are always present.

11. Simulation UX

Simulations are CFO-focused, auto-suggested, reusable, and allow multiple fixes. They operate on snapshots and never mutate source data.

12. Revenue Recognition UX

Revenue recognition is embedded contextually inside Issues and Contracts. Tables are favored over charts. Manual changes are disallowed; simulation only.

13. Exports & Sharing

Exports are point-in-time snapshots. PDFs resemble audit reports. Email digests are action-driven. No external sharing links are supported in MVP.

14. Notifications & Nudges

Users are notified of high-impact issues and data freshness problems. Nudges surface unreviewed items without overwhelming the user.

15. Auditability & Trust

Snapshot metadata is available on demand. A dedicated audit view and one-click audit bundles are supported.

16. Visual & Interaction Style

Hybrid professional and modern SaaS aesthetic. Light and dark modes supported. Color is used sparingly and accessibly.

17. Future-Proofing

The UX anticipates multi-entity, multi-currency, and advanced finance maturity while assuming expert users and offering selective coaching.

18. UX Success Criteria

Users achieve time-to-value within hours, trust issue outputs, confidently run simulations, and export audit-ready outputs without assistance.
